SYNTHETIC RESEARCH NOTE - INVENTED DATA - NOT EVIDENCE FOR CLINICAL DECISIONS

Synthetic audit note: new-case preparation completeness

Design: Retrospective fictional audit of 40 invented new-case preparation packets.

Population: Invented adult new-case referrals to a fictional haematology-oncology service.

Finding 1: Packets with documented identity review of every source document had fewer callbacks for missing information.

Finding 2: Recording patient goals before scheduling reduced rescheduled preparation visits in this invented sample.

Finding 3: Handoffs that were explicitly accepted by a named team member were completed more often than unacknowledged handoffs.

Limitation: Invented data for software demonstration; single fictional site; no clinical outcome was measured.

Limitation: No comparison group; the direction of any association is unknown.
